

Overview of the CDAW events

Nat Gopalswamy

In this paper, I present an overview of the solar and interplanetary characteristics of the events selected to be analyzed during the workshop. The events were selected based on the following criteria:

1. The events must be well observed in the interplanetary medium as shock-driving interplanetary coronal mass ejections (ICMEs),
2. The ICMEs should have corresponding CMEs near the Sun, observed in white-light coronal images, and
3. The heliographic coordinates of the solar sources must be within 15 degrees from the Sun Center.

This presentation will set the stage for the rest of the discussion during the workshop.
